Frequently Asked Questions

What is the main concept behind factoring in

algebra?

Factoring involves expressing a mathematical expression, usually a polynomial, as a product of its simpler factors, which helps in solving equations and simplifying expressions.

How do I factor a quadratic expression like $y^2 - 9$?

The expression $y^2 - 9$ is a difference of squares. It can be factored as $(y + 3)(y - 3)$.

What does 'factor $y - 9$ ' mean in algebra?

It typically refers to finding the factors of the expression $y - 9$, which is already linear, so its factors are simply $y - 9$ itself or understanding how it can be part of larger factorizations.

Can I factor $y - 9$ further?

No, $y - 9$ is a linear binomial and cannot be factored further over the real numbers.

Why is factoring important in solving equations?

Factoring helps break down complex expressions into simpler parts, making it easier to find solutions to equations by setting factors equal to zero.

Are there special techniques for factoring expressions like $y^2 - 9$?

Yes, recognizing differences of squares like $y^2 - 9$ allows you to quickly factor the expression as $(y + 3)(y - 3)$.

What should I do if I can't factor a polynomial like $y^3 + 27$?

You can try factoring by sum of cubes: $y^3 + 27 = (y + 3)(y^2 - 3y + 9)$.

How can I check if my factorization is correct?

Multiply the factors back together and see if you get the original expression. If yes, your factorization is correct.
