Are Hurricanes Becoming More Or Less Common Compared To 100 Years Ago?

Hurricanes have long been a formidable force of nature, shaping the climate and landscapes of coastal regions around the world. Over the past century, concerns about the changing frequency and intensity of these powerful storms have grown, driven largely by the impacts of climate change and evolving observational methods. This article explores whether hurricanes are becoming more or less common compared to a hundred years ago by examining historical data, scientific research, and climate trends. Through this analysis, we aim to provide a comprehensive understanding of how hurricane patterns are evolving in the context of a changing global climate.
