- Discounted Cash Flow (DCF): Based on projected free cash flows, discounting back at a weighted average cost of capital (WACC).
- Price-to-Earnings (P/E) Ratio: Using industry and historical P/E ratios to estimate future stock prices.
- Relative Valuation: Comparing Callahan’s metrics to peer companies.

DCF Valuation

Assuming:

- Free cash flow (FCF) grows at a rate aligned with earnings.
- WACC of approximately 8%.
- A terminal growth rate of 3% after Year 5.

Projected FCFs:

Year	FCF (USD millions)
Year 1	1,200
Year 2	1,320
Year 3	1,452
Year 4	1,597
Year 5	1,757

Present value calculations yield an estimated enterprise value of around USD 25 billion. Dividing by the number of outstanding shares (~200 million), the fair value per share approximates USD 125.

Market Sentiment and P/E Ratio

The current industry P/E ratio averages around 25. Applying this to projected earnings (~USD 1.39 billion in Year 5), the implied stock price is:

USD 1.39 billion / 200 million shares = USD 6.95 earnings per share

USD 6.95 x 25 = USD 173.75

This suggests an optimistic valuation, contingent on sustained growth and market conditions.

Risks and Uncertainties

Forecasts inherently involve uncertainties. Key risks include:
