

4. WHICH INEQUALITY DESCRIBES ALL THE SOLUTIONS TO $11(3 - X) < -2x + 6$? $x < -27$? $x > 3$? $x < -3$?

4. WHICH INEQUALITY DESCRIBES ALL THE SOLUTIONS TO $11(3 - X) < -2x + 6$? $x < -27$? $x > 3$? $x < -3$?

UNDERSTANDING INEQUALITIES IS FUNDAMENTAL IN ALGEBRA, AS THEY ALLOW US TO DESCRIBE RANGES OF SOLUTIONS RATHER THAN SPECIFIC VALUES. WHEN DEALING WITH MULTIPLE INEQUALITIES COMBINED WITHIN A PROBLEM, IT'S ESSENTIAL TO ANALYZE EACH CAREFULLY AND FIND THE COMMON SOLUTION SET THAT SATISFIES ALL CONDITIONS SIMULTANEOUSLY. THE GIVEN PROBLEM PRESENTS SEVERAL INEQUALITIES INTERTWINED WITH THE VARIABLE X , MAKING IT CRUCIAL TO DECODE EACH PART STEP-BY-STEP.

IN THIS ARTICLE, WE WILL EXPLORE HOW TO INTERPRET AND SOLVE THE COMPOUND INEQUALITIES IN THE PROBLEM, IDENTIFY THE SET OF SOLUTIONS, AND DETERMINE WHICH SINGLE INEQUALITY ACCURATELY DESCRIBES ALL SOLUTIONS. WE WILL ALSO DELVE INTO THE IMPORTANCE OF INEQUALITIES IN MATHEMATICAL REASONING AND PROVIDE COMPREHENSIVE GUIDANCE FOR LEARNERS TACKLING SIMILAR PROBLEMS.

BREAKING DOWN THE PROBLEM: UNDERSTANDING THE INEQUALITIES

THE GIVEN PROBLEM STATEMENT IS SOMEWHAT CONDENSED BUT CAN BE INTERPRETED AS MULTIPLE INEQUALITIES CONNECTED WITH THE VARIABLE X :

- $11(3 - X) < -2X + 6$
- $X < -27$
- $3X < -3$

THE QUESTION ASKS: WHICH INEQUALITY DESCRIBES ALL THE SOLUTIONS TO THESE COMBINED INEQUALITIES?

LET'S ANALYZE EACH INEQUALITY SEPARATELY.

1. ANALYZING $11(3 - X) < -2X + 6$

THIS INEQUALITY INVOLVES AN EXPRESSION WITH 11 MULTIPLIED BY $(3 - X)$, COMPARED TO $-2X + 6$.

STEP-BY-STEP SOLUTION:

- DISTRIBUTE 11: $11 \cdot 3 - 11X < -2X + 6$
- SIMPLIFY: $33 - 11X < -2X + 6$

NEXT, GROUP LIKE TERMS:

- BRING VARIABLES TO ONE SIDE AND CONSTANTS TO THE OTHER:

$$33 - 11X + 2X < 6$$

- SIMPLIFY:

$$33 - 9X < 6$$

SUBTRACT 33 FROM BOTH SIDES:

$$-9X < 6 - 33$$

$$-9X < -27$$

DIVIDE BOTH SIDES BY -9 (REMEMBER TO REVERSE THE INEQUALITY WHEN DIVIDING BY A NEGATIVE):

$$X > -27$$

RESULT:

$$X > -27$$

2. ANALYZING $X < -27X$

THIS INEQUALITY RELATES X TO $-27X$:

STEP-BY-STEP SOLUTION:

- BRING ALL TERMS TO ONE SIDE:

$$X + 27X < 0$$

- SIMPLIFY:

$$28X < 0$$

DIVIDE BOTH SIDES BY 28:

$$X < 0$$

RESULT:

$$X < 0$$

3. ANALYZING $3X < -3X$

THIS INEQUALITY COMPARES $3X$ TO $-3X$:

STEP-BY-STEP SOLUTION:

- ADD $3X$ TO BOTH SIDES:

$$3X + 3X < 0$$

$$6X < 0$$

DIVIDE BOTH SIDES BY 6:

$$X < 0$$

RESULT:

$$X < 0$$

COMBINING THE SOLUTIONS: FINDING THE INTERSECTION

AFTER ANALYZING EACH INEQUALITY SEPARATELY, WE OBSERVE:

- FROM THE FIRST INEQUALITY: $X > -27$
- FROM THE SECOND AND THIRD INEQUALITIES: $X < 0$

THE SET OF SOLUTIONS SATISFYING ALL INEQUALITIES SIMULTANEOUSLY IS THE INTERSECTION OF THESE SOLUTION SETS:

- $X > -27$
- $X < 0$

EXPRESSED AS AN INTERVAL:

SOLUTION SET: $(-27, 0)$

THIS MEANS ALL REAL NUMBERS GREATER THAN -27 AND LESS THAN 0 SATISFY THE ENTIRE SET OF INEQUALITIES.

IDENTIFYING THE INEQUALITY THAT DESCRIBES ALL SOLUTIONS

NOW, THE CORE QUESTION IS: WHICH SINGLE INEQUALITY DESCRIBES ALL SOLUTIONS TO THE COMBINED INEQUALITIES?

GIVEN THE SOLUTION SET IS:

$X \in (-27, 0)$

WE NEED AN INEQUALITY THAT CAPTURES THIS INTERVAL PRECISELY.

CANDIDATE INEQUALITIES:

- $X > -27$ AND $X < 0$

THIS CAN BE COMBINED AS:

- $-27 < X < 0$

WHICH IS A DOUBLE INEQUALITY REPRESENTING THE ENTIRE SOLUTION SET.

POSSIBLE INEQUALITIES THAT ENCOMPASS THE SOLUTION SET

TO DESCRIBE THE INTERVAL $(-27, 0)$, THE INEQUALITY IS:

- $-27 < X < 0$

THIS IS THE PRIMARY INEQUALITY THAT DESCRIBES ALL SOLUTIONS TO THE SET OF INEQUALITIES.

ALTERNATIVE REPRESENTATIONS INCLUDE:

- $X > -27$ AND $X < 0$ (CONJUNCTION)
- $-27 < X < 0$ (DOUBLE INEQUALITY)

IN THE CONTEXT OF THE ORIGINAL PROBLEM, THE QUESTION MIGHT BE ASKING FOR THE MOST CONCISE INEQUALITY THAT ENCOMPASSES ALL SOLUTIONS.

UNDERSTANDING THE SIGNIFICANCE OF THE SOLUTION INTERVAL

KNOWING THE INTERVAL $(-27, 0)$ HELPS IN UNDERSTANDING THE BEHAVIOR OF THE VARIABLE X WITHIN THE SOLUTION SET. THIS INTERVAL EXCLUDES THE ENDPOINTS -27 AND 0 , INDICATING THAT THE SOLUTIONS ARE STRICTLY BETWEEN THESE TWO VALUES.

WHY IS THIS IMPORTANT?

- IT HELPS IN GRAPHING THE SOLUTION SET ON A NUMBER LINE.
- IT ASSISTS IN UNDERSTANDING THE CONSTRAINTS ON X .
- IT ENABLES THE FORMULATION OF A SINGLE INEQUALITY THAT SUCCINCTLY DESCRIBES ALL SOLUTIONS.

VISUAL REPRESENTATION OF THE SOLUTION SET

VISUALIZING THE SOLUTIONS ON A NUMBER LINE PROVIDES CLARITY:

- DRAW A NUMBER LINE.
- MARK THE POINTS -27 AND 0 .
- USE OPEN CIRCLES AT -27 AND 0 TO INDICATE THESE POINTS ARE NOT INCLUDED.
- SHADE THE REGION BETWEEN -27 AND 0 .

THIS VISUAL REINFORCES THE UNDERSTANDING THAT THE SOLUTIONS ARE ALL REAL NUMBERS BETWEEN THESE TWO POINTS.

PRACTICAL APPLICATIONS OF THESE INEQUALITIES

INEQUALITIES SUCH AS THESE ARE ESSENTIAL IN VARIOUS FIELDS:

- MATHEMATICS EDUCATION: TEACHING STUDENTS HOW TO INTERPRET AND SOLVE COMPOUND INEQUALITIES.
- ENGINEERING: DEFINING ACCEPTABLE RANGES FOR VARIABLES LIKE TEMPERATURE, PRESSURE, OR VOLTAGE.
- ECONOMICS: MODELING CONSTRAINTS SUCH AS BUDGET LIMITS OR RESOURCE ALLOCATIONS.
- SCIENCE: ESTABLISHING SAFE OR OPERATIONAL RANGES FOR EXPERIMENTAL CONDITIONS.

UNDERSTANDING HOW TO ANALYZE AND COMBINE INEQUALITIES EQUIPS LEARNERS WITH CRITICAL PROBLEM-SOLVING SKILLS APPLICABLE ACROSS DISCIPLINES.

SUMMARY AND KEY TAKEAWAYS

- THE ORIGINAL PROBLEM INVOLVES MULTIPLE INEQUALITIES:
 - $11(3 - x) < -2x + 6$
 - $x < -27x$
 - $3x < -3x$
 - SOLVING EACH YIELDS:
 - $x > -27$
 - $x < 0$
 - $x < 0$
 - THE INTERSECTION OF THESE SOLUTIONS IS THE INTERVAL $(-27, 0)$.
 - THE INEQUALITY THAT DESCRIBES ALL SOLUTIONS IS:
 $-27 < x < 0$
 - VISUALIZING THIS INTERVAL HELPS IN UNDERSTANDING THE SOLUTION SET.
 - RECOGNIZING THESE INEQUALITIES' PRACTICAL APPLICATIONS UNDERSCORES THEIR IMPORTANCE.
-

CONCLUSION

THE COMPREHENSIVE ANALYSIS REVEALS THAT THE INEQUALITY $-27 < x < 0$ PRECISELY CAPTURES ALL SOLUTIONS THAT SATISFY THE SET OF INEQUALITIES PROVIDED IN THE PROBLEM. UNDERSTANDING HOW TO INTERPRET, SOLVE, AND COMBINE INEQUALITIES IS FUNDAMENTAL IN ALGEBRA AND MATHEMATICAL PROBLEM-SOLVING. WHETHER FOR ACADEMIC PURPOSES OR PRACTICAL APPLICATIONS, MASTERING INEQUALITIES ALLOWS FOR EFFECTIVE MODELING OF REAL-WORLD CONSTRAINTS AND CONDITIONS.

BY BREAKING DOWN COMPLEX INEQUALITIES INTO MANAGEABLE PARTS, LEARNERS CAN DEVELOP A STRONG FOUNDATION IN ALGEBRAIC REASONING, ENABLING THEM TO TACKLE INCREASINGLY ADVANCED MATHEMATICAL CHALLENGES WITH CONFIDENCE.

FREQUENTLY ASKED QUESTIONS

WHAT INEQUALITY DESCRIBES ALL SOLUTIONS TO $11(3 - x) < -2x + 6$?

FIRST, EXPAND $11(3 - x)$ TO $33 - 11x$. THE INEQUALITY BECOMES $33 - 11x < -2x + 6$. SUBTRACT $-2x$ FROM BOTH SIDES: $33 - 11x + 2x < 6$. SIMPLIFY: $33 - 9x < 6$. SUBTRACT 33 FROM BOTH SIDES: $-9x < -27$. DIVIDE BOTH SIDES BY -9 (AND REVERSE INEQUALITY SIGN): $x > 3$. SO, ALL SOLUTIONS SATISFY $x > 3$.

HOW DO YOU SOLVE THE INEQUALITY $11(3 - x) < -2x + 6$?

EXPAND TO $33 - 11x < -2x + 6$. BRING ALL x TERMS TO ONE SIDE: $-11x + 2x < 6 - 33$. SIMPLIFY: $-9x < -27$. DIVIDE BOTH SIDES BY -9 AND FLIP THE INEQUALITY: $x > 3$.

WHAT IS THE SOLUTION SET FOR $11(3 - x) < -2x + 6$?

THE SOLUTION SET IS ALL REAL NUMBERS GREATER THAN 3, EXPRESSED AS $x > 3$.

WHAT INEQUALITY REPRESENTS ALL SOLUTIONS TO $-27x > 3x$?

COMBINE LIKE TERMS: $-27x > 3x$. SUBTRACT $3x$ FROM BOTH SIDES: $-27x - 3x > 0$. SIMPLIFY: $-30x > 0$. DIVIDE BOTH SIDES BY -30 (AND REVERSE INEQUALITY): $x < 0$.

HOW DO YOU SOLVE THE INEQUALITY $-27x > 3x$?

SUBTRACT $3x$ FROM BOTH SIDES TO GET $-27x - 3x > 0$, WHICH SIMPLIFIES TO $-30x > 0$. DIVIDING BOTH SIDES BY -30 (AND REVERSING THE INEQUALITY) YIELDS $x < 0$.

WHAT IS THE COMBINED SOLUTION FOR THE INEQUALITIES $11(3 - x) < -2x + 6$ AND $-27x > 3x$?

FROM THE FIRST INEQUALITY, $x > 3$; FROM THE SECOND, $x < 0$. SINCE THESE ARE MUTUALLY EXCLUSIVE, THERE IS NO COMMON SOLUTION SET; THE COMBINED SET IS EMPTY.

ARE THERE ANY VALUES OF x THAT SATISFY BOTH INEQUALITIES $11(3 - x) < -2x + 6$ AND $-27x > 3x$?

NO, BECAUSE $11(3 - x) < -2x + 6$ SIMPLIFIES TO $x > 3$, WHILE $-27x > 3x$ SIMPLIFIES TO $x < 0$; THESE CONDITIONS CANNOT BE TRUE SIMULTANEOUSLY.

CAN THE SOLUTION TO $11(3 - x) < -2x + 6$ BE WRITTEN IN INTERVAL NOTATION?

YES, THE SOLUTION IS $x > 3$, WHICH IN INTERVAL NOTATION IS $(3, \infty)$.

WHAT IS THE SIGNIFICANCE OF REVERSING THE INEQUALITY SIGN WHEN DIVIDING BOTH SIDES BY A NEGATIVE NUMBER?

WHEN DIVIDING BOTH SIDES OF AN INEQUALITY BY A NEGATIVE, THE DIRECTION OF THE INEQUALITY MUST BE REVERSED TO PRESERVE THE TRUTH OF THE STATEMENT, AS PER INEQUALITY RULES.

WHY DO THE INEQUALITIES $x > 3$ AND $x < 0$ HAVE NO SOLUTION IN COMMON?

BECAUSE A NUMBER CANNOT BE SIMULTANEOUSLY GREATER THAN 3 AND LESS THAN 0; THESE CONDITIONS ARE MUTUALLY EXCLUSIVE, RESULTING IN NO COMMON SOLUTIONS.

ADDITIONAL RESOURCES

INEQUALITY ANALYSIS AND SOLUTION BREAKDOWN: A DEEP DIVE INTO ALGEBRAIC INEQUALITIES

UNDERSTANDING THE CORE INEQUALITY CHALLENGES

MATHEMATICS, ESPECIALLY ALGEBRA, INVOLVES UNRAVELING COMPLEX EXPRESSIONS TO FIND SOLUTIONS THAT SATISFY

CERTAIN RELATIONSHIPS. WHEN DEALING WITH MULTIPLE INEQUALITIES, THE GOAL IS TO UNDERSTAND HOW THESE CONSTRAINTS INTERACT, OVERLAP, AND DEFINE THE SET OF ALL POSSIBLE SOLUTIONS. TODAY, WE'RE DELVING INTO A PARTICULARLY INTRIGUING SET OF INEQUALITIES:

$$\begin{aligned} & - \ (\ 11(3 - x) < -2x + 6 \) \\ & - \ (x < -27 \) \\ & - \ (x > 3x \) \\ & - \ (-3x \) \end{aligned}$$

AT FIRST GLANCE, THESE EXPRESSIONS MIGHT SEEM DISJOINTED OR CONFUSING, BUT WITH CAREFUL ANALYSIS, THEY REVEAL A COHESIVE PICTURE. THIS ARTICLE PROVIDES A DETAILED, EXPERT-LEVEL REVIEW OF EACH INEQUALITY, HOW THEY INTERCONNECT, AND THE COMPREHENSIVE SOLUTION SET THEY DEFINE.

DISSECTING EACH INEQUALITY

1. ANALYZING $(\ 11(3 - x) < -2x + 6 \)$

THIS INEQUALITY IS A FUNDAMENTAL STARTING POINT. IT INVOLVES A LINEAR EXPRESSION ON THE LEFT AND RIGHT SIDES, WHICH CAN BE SIMPLIFIED:

$$\begin{aligned} & \ (\\ & \ 11(3 - x) < -2x + 6 \\ & \) \end{aligned}$$

STEP 1: EXPAND THE LEFT SIDE

$$\begin{aligned} & \ (\\ & \ 33 - 11x < -2x + 6 \\ & \) \end{aligned}$$

STEP 2: REARRANGE TERMS TO ISOLATE $(\ x \)$

SUBTRACT $(-2x)$ FROM BOTH SIDES:

$$\begin{aligned} & \ (\\ & \ 33 - 11x + 2x < 6 \\ & \) \end{aligned}$$

WHICH SIMPLIFIES TO:

$$\begin{aligned} & \ (\\ & \ 33 - 9x < 6 \\ & \) \end{aligned}$$

SUBTRACT 33 FROM BOTH SIDES:

$$\begin{aligned} & \ (\\ & \ -9x < 6 - 33 \\ & \) \end{aligned}$$

$$\begin{aligned} & \ (\\ & \ -9x < -27 \\ & \) \end{aligned}$$

STEP 3: SOLVE FOR (x)

DIVIDE BOTH SIDES BY (-9) . REMEMBER, DIVIDING AN INEQUALITY BY A NEGATIVE REVERSES THE INEQUALITY SIGN:

$$\begin{aligned} & \{ \\ x & > \frac{-27}{-9} \\ & \} \end{aligned}$$

$$\begin{aligned} & \{ \\ x & > 3 \\ & \} \end{aligned}$$

CONCLUSION: THE FIRST INEQUALITY SIMPLIFIES TO:

$$\begin{aligned} & \{ \\ x & > 3 \\ & \} \end{aligned}$$

THIS IS A CRITICAL CONDITION: ANY SOLUTION MUST SATISFY $(x > 3)$.

2. THE INEQUALITY $(x < -27)$

THIS IS STRAIGHTFORWARD: THE SOLUTION SET FOR THIS INEQUALITY IS:

$$\begin{aligned} & \{ \\ x & < -27 \\ & \} \end{aligned}$$

THIS CONDITION RESTRICTS SOLUTIONS TO VALUES LESS THAN (-27) .

OBSERVATION: SINCE $(x > 3)$ FROM THE FIRST INEQUALITY AND $(x < -27)$, THESE TWO CONDITIONS ARE MUTUALLY EXCLUSIVE BECAUSE NO NUMBER CAN BE BOTH GREATER THAN 3 AND LESS THAN -27 SIMULTANEOUSLY. THEREFORE, THE INEQUALITIES $(11(3 - x) < -2x + 6)$ AND $(x < -27)$ CANNOT BE SATISFIED TOGETHER—THEY DEFINE DISJOINT SOLUTION REGIONS.

3. THE INEQUALITY $(x > 3x)$

LET'S ANALYZE:

$$\begin{aligned} & \{ \\ x & > 3x \\ & \} \end{aligned}$$

SUBTRACT $(3x)$ FROM BOTH SIDES:

$$\begin{aligned} & \{ \\ x - 3x & > 0 \\ & \} \end{aligned}$$

$$\begin{aligned} & \{ \\ -2x & > 0 \end{aligned}$$

$\backslash$

DIVIDE BOTH SIDES BY $\backslash(-2\backslash)$ (REVERSE INEQUALITY):

$\backslash$

$x < 0$

$\backslash$

RESULT: THE INEQUALITY SIMPLIFIES TO:

$\backslash$

$x < 0$

$\backslash$

THIS CONDITION CONSTRAINS SOLUTIONS TO ALL $\backslash(x \backslash)$ LESS THAN ZERO.

4. THE EXPRESSION $\backslash(-3x \backslash)$

THIS IS JUST AN EXPRESSION, NOT AN INEQUALITY BY ITSELF. HOWEVER, IT MIGHT BE PART OF THE PROBLEM CONTEXT OR A MISPRINT. ASSUMING THE INTENDED INEQUALITY WAS RELATED TO $\backslash(-3x \backslash)$, PERHAPS:

- $\backslash(-3x > \text{SOME VALUE} \backslash)$,
- OR $\backslash(-3x < \text{SOME VALUE} \backslash)$.

SINCE THE ORIGINAL PROMPT IS SOMEWHAT AMBIGUOUS, AND NO INEQUALITY SIGN IS ASSOCIATED DIRECTLY, WE CAN CONSIDER THE POSSIBILITY THAT THE KEY INEQUALITIES ARE:

- $\backslash(11(3 - x) < -2x + 6 \backslash)$,
- $\backslash(x < -27 \backslash)$,
- $\backslash(x > 3x \backslash)$,
- AND PERHAPS SOME IMPLICIT RELATION INVOLVING $\backslash(-3x \backslash)$.

GIVEN THE CONTEXT, THE MAIN FOCUS APPEARS TO BE ON THE INEQUALITIES INVOLVING $\backslash(x \backslash)$.

COMPREHENSIVE SOLUTION SET ANALYSIS

NOW, SYNTHESIZING THE INSIGHTS FROM EACH INDIVIDUAL INEQUALITY:

- FROM THE FIRST INEQUALITY, $\backslash(x > 3 \backslash)$.
- FROM THE THIRD INEQUALITY, $\backslash(x < 0 \backslash)$.
- FROM THE SECOND INEQUALITY, $\backslash(x < -27 \backslash)$.

KEY OBSERVATION: THE INEQUALITIES SPECIFY THE FOLLOWING:

- FOR THE FIRST INEQUALITY TO HOLD, $\backslash(x > 3 \backslash)$.
- FOR THE THIRD INEQUALITY TO HOLD, $\backslash(x < 0 \backslash)$.
- FOR THE SECOND INEQUALITY, $\backslash(x < -27 \backslash)$.

GIVEN THAT THE FIRST AND THIRD INEQUALITIES SEEM TO HAVE CONFLICTING CONDITIONS:

- $\backslash(x > 3 \backslash)$ (FROM THE FIRST)

- $(x < 0)$ (FROM THE THIRD)

THESE TWO ARE INCOMPATIBLE BECAUSE (x) CANNOT BE BOTH GREATER THAN 3 AND LESS THAN 0 SIMULTANEOUSLY. THEREFORE, THE COMBINED SOLUTION SET FOR THESE TWO INEQUALITIES IS EMPTY.

SIMILARLY, THE SECOND INEQUALITY STIPULATES $(x < -27)$. ANY (x) THAT SATISFIES THIS IS LESS THAN (-27) . COMPARING THIS WITH THE THIRD INEQUALITY'S SOLUTION $(x < 0)$, THE SECOND INEQUALITY'S SOLUTIONS ARE A SUBSET OF THE THIRD, SINCE ANY NUMBER LESS THAN (-27) IS ALSO LESS THAN 0.

FINAL SOLUTION SYNTHESIS

TO DETERMINE WHICH SOLUTIONS SATISFY ALL THE INEQUALITIES SIMULTANEOUSLY, WE NEED TO FIND THE INTERSECTION OF THEIR SOLUTION SETS.

SUMMARY:

- $11(3 - x) < -2x + 6 \implies (x > 3)$
- $(x < -27)$
- $(x < 0)$

ANALYZING THE INTERSECTIONS:

- SINCE $(x > 3)$ AND $(x < -27)$ ARE MUTUALLY EXCLUSIVE, THE COMBINED SOLUTION SET FOR THE FIRST TWO INEQUALITIES IS EMPTY.

- THE THIRD INEQUALITY $(x < 0)$ OVERLAPS WITH $(x < -27)$, BUT NOT WITH $(x > 3)$.

THEREFORE:

- THE INEQUALITY $11(3 - x) < -2x + 6$ (WHICH REQUIRES $(x > 3)$) CANNOT BE SATISFIED SIMULTANEOUSLY WITH $(x < -27)$, SO THE OVERALL SYSTEM HAS NO COMMON SOLUTIONS INVOLVING ALL THESE INEQUALITIES.
- THE ONLY CONSISTENT SUBSET IS WHEN CONSIDERING $(x < -27)$ AND $(x < 0)$, WHICH SIMPLIFIES TO $(x < -27)$.

CONCLUSION: THE KEY INEQUALITY THAT DESCRIBES ALL SOLUTIONS

GIVEN THE ABOVE ANALYSIS, THE INEQUALITY THAT ENCAPSULATES ALL THE SOLUTIONS TO THE COMBINED SYSTEM IS:

$$\boxed{x < -27}$$

WHY? BECAUSE:

- IT SATISFIES THE INEQUALITIES $(x < -27)$ AND $(x < 0)$,
- IT IS INCOMPATIBLE WITH $(x > 3)$ (FROM THE FIRST INEQUALITY),
- IT REPRESENTS THE ONLY NON-EMPTY SOLUTION SET WHEN CONSIDERING ALL INEQUALITIES TOGETHER.

EXPERT INSIGHT AND FINAL REMARKS

THIS COMPREHENSIVE BREAKDOWN REVEALS THE IMPORTANCE OF SYSTEMATIC ANALYSIS IN INEQUALITY PROBLEMS. THE INITIAL INEQUALITIES, ESPECIALLY $\{11(3 - x) < -2x + 6\}$ AND $\{x > 3x\}$, ENFORCE MUTUALLY EXCLUSIVE CONDITIONS THAT PREVENT A SIMULTANEOUS SOLUTION WITH THE OTHER INEQUALITIES. THE ONLY CONSISTENT SUBSET EMERGES FROM $\{x < -27\}$, WHICH SATISFIES BOTH THE INEQUALITY CONSTRAINTS AND THE LOGICAL STRUCTURE OF THE PROBLEM.

KEY TAKEAWAYS:

- ALWAYS SIMPLIFY INEQUALITIES THOROUGHLY BEFORE ATTEMPTING TO FIND THE INTERSECTION OF SOLUTION SETS.
- BE CAUTIOUS OF MUTUALLY EXCLUSIVE CONDITIONS—SOME INEQUALITIES INHERENTLY CONFLICT.
- WHEN MULTIPLE INEQUALITIES ARE INVOLVED, ANALYZE EACH INDIVIDUALLY AND THEN FIND THE INTERSECTION.
- RECOGNIZE THAT THE MOST RESTRICTIVE INEQUALITY OFTEN DEFINES THE OVERALL SOLUTION SET.

IN CONCLUSION, THE INEQUALITY $\{x < -27\}$ IS THE DEFINITIVE STATEMENT ENCAPSULATING THE SOLUTIONS TO THE COMBINED INEQUALITY SYSTEM DISCUSSED. THIS INSIGHT UNDERSCORES THE IMPORTANCE OF DETAILED, STEP-BY-STEP ANALYSIS IN MASTERING ALGEBRAIC INEQUALITIES AND SOLVING COMPLEX SYSTEMS EFFECTIVELY.

4 Which Inequality Describes All The Solutions To $11 \leq 3x$ $6x \leq 27$ $x > 3$ $x < 3$

4 Which Inequality Describes All The Solutions To $11 \leq 3x$ $6x \leq 27$ $x > 3$ $x < 3$
