A 13-year-old Boy Is Admitted To The Hospital Due To Fever And Fatigue For The Past Week. The Patient

When a young patient presents with persistent fever and fatigue over several days, it prompts a thorough medical evaluation to determine the underlying cause. Such symptoms in a 13-year-old boy can be attributed to a variety of conditions, ranging from infections to autoimmune diseases or hematologic disorders. Early diagnosis and appropriate management are crucial to prevent complications and ensure the child's recovery. This article explores the possible causes, diagnostic approaches, and treatment options for a teenage patient presenting with these symptoms.
