

LINE T HAS A SLOPE OF $-\frac{2}{3}$. LINE U HAS A SLOPE OF $\frac{2}{3}$. ARE LINE T AND LINE U PARALLEL, PERPENDICULAR,

LINE T HAS A SLOPE OF $-\frac{2}{3}$. LINE U HAS A SLOPE OF $\frac{2}{3}$. ARE LINE T AND LINE U PARALLEL, PERPENDICULAR, AND WHAT DOES THEIR RELATIONSHIP REVEAL ABOUT THEIR ORIENTATION ON THE COORDINATE PLANE? UNDERSTANDING THE SLOPES OF LINES IS FUNDAMENTAL IN COORDINATE GEOMETRY, AS IT HELPS DETERMINE HOW LINES RELATE TO EACH OTHER—WHETHER THEY ARE PARALLEL, PERPENDICULAR, OR INTERSECT AT SOME ANGLE. IN THIS ARTICLE, WE WILL EXPLORE WHAT THE SLOPES OF $-\frac{2}{3}$ AND $\frac{2}{3}$ SIGNIFY, ANALYZE THEIR GEOMETRIC RELATIONSHIP, AND DISCUSS HOW TO IDENTIFY WHETHER TWO LINES ARE PARALLEL OR PERPENDICULAR BASED ON THEIR SLOPES.

UNDERSTANDING THE SLOPE OF A LINE

WHAT IS A SLOPE?

THE SLOPE OF A LINE MEASURES ITS STEEPNESS AND DIRECTION. IT IS TYPICALLY DENOTED BY THE LETTER m AND CALCULATED AS THE RATIO OF THE CHANGE IN y TO THE CHANGE IN x BETWEEN TWO POINTS ON THE LINE:

$$m = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1}$$

A POSITIVE SLOPE INDICATES THAT THE LINE RISES FROM LEFT TO RIGHT, WHILE A NEGATIVE SLOPE INDICATES IT FALLS.

INTERPRETING SLOPES OF $-\frac{2}{3}$ AND $\frac{2}{3}$

- LINE T WITH A SLOPE OF $-\frac{2}{3}$: THIS MEANS THAT FOR EVERY 3 UNITS MOVED HORIZONTALLY TO THE RIGHT, THE LINE MOVES 2 UNITS DOWNWARD.
- LINE U WITH A SLOPE OF $\frac{2}{3}$: CONVERSELY, THIS LINE RISES 2 UNITS FOR EVERY 3 UNITS MOVED HORIZONTALLY TO THE RIGHT.

THIS RECIPROCAL NATURE OF THE SLOPES SUGGESTS AN INTERESTING RELATIONSHIP, WHICH WE WILL ANALYZE FURTHER IN THE CONTEXT OF PARALLELISM AND PERPENDICULARITY.

PARALLEL LINES: WHEN DO LINES HAVE THE SAME SLOPE?

DEFINITION OF PARALLEL LINES

TWO LINES ARE PARALLEL IF THEY LIE IN THE SAME PLANE AND NEVER INTERSECT, NO MATTER HOW FAR THEY EXTEND. GEOMETRICALLY, THIS MEANS THEY HAVE THE SAME SLOPE BUT DIFFERENT y -INTERCEPTS.

ARE LINE T AND LINE U PARALLEL?

SINCE:

- SLOPE OF LINE T = $-\frac{2}{3}$
- SLOPE OF LINE U = $\frac{2}{3}$

AND THESE SLOPES ARE NOT EQUAL, LINE T AND LINE U ARE NOT PARALLEL. PARALLEL LINES WOULD REQUIRE THEIR SLOPES TO BE IDENTICAL, WHICH IS NOT THE CASE HERE.

PERPENDICULAR LINES: WHEN DO LINES HAVE OPPOSITE RECIPROCAL SLOPES?

DEFINITION OF PERPENDICULAR LINES

TWO LINES ARE PERPENDICULAR IF THEY INTERSECT AT A RIGHT ANGLE (90 DEGREES). IN THE COORDINATE PLANE, THE SLOPES OF PERPENDICULAR LINES ARE NEGATIVE RECIPROCAL OF EACH OTHER.

MATHEMATICALLY:

$$m_1 \times m_2 = -1$$

WHERE (m_1) AND (m_2) ARE THE SLOPES OF THE TWO LINES.

ARE LINE T AND LINE U PERPENDICULAR?

LET'S VERIFY:

$$m_T = -\frac{2}{3}$$

$$m_U = \frac{2}{3}$$

MULTIPLYING THESE:

$$m_T \times m_U = -\frac{2}{3} \times \frac{2}{3} = -\frac{4}{9}$$

SINCE $(-\frac{4}{9} \neq -1)$, LINE T AND LINE U ARE NOT PERPENDICULAR.

HOWEVER, NOTICE THAT THE SLOPES ARE NEGATIVE RECIPROCAL IF WE CONSIDER THEIR RECIPROCAL:

$$-\frac{2}{3} \quad \text{AND} \quad \frac{3}{2}$$

WHICH ARE NEGATIVE RECIPROCAL, BUT THE SLOPE OF LINE U IS $(\frac{2}{3})$, NOT $(\frac{3}{2})$. THEREFORE, THE LINES ARE NOT PERPENDICULAR IN THE STRICT SENSE.

SUMMARY OF RELATIONSHIPS BETWEEN LINE T AND LINE U

RELATIONSHIP	CONDITION	SLOPE(S)	ARE THE LINES PARALLEL?	ARE THE LINES PERPENDICULAR?
PARALLEL	SAME SLOPE	$(-\frac{2}{3})$ AND $(\frac{2}{3})$	No	No
PERPENDICULAR	SLOPES ARE NEGATIVE RECIPROCAL	$(m_1 \times m_2 = -1)$	No	No

CONCLUSION:

LINE T AND LINE U ARE NEITHER PARALLEL NOR PERPENDICULAR BASED SOLELY ON THEIR SLOPES.

VISUALIZING THE LINES

PLOTTING THE LINES CAN HELP IN UNDERSTANDING THEIR ORIENTATION:

- LINE T (SLOPE = $-2/3$): RISES DOWNWARD AS IT MOVES RIGHTWARD.
- LINE U (SLOPE = $2/3$): RISES UPWARD AS IT MOVES RIGHTWARD.

THEIR SLOPES ARE NEGATIVES OF EACH OTHER IN MAGNITUDE BUT ARE NOT RECIPROCALLS, INDICATING THEY CROSS EACH OTHER AT SOME ANGLE THAT IS NOT 90 DEGREES.

ADDITIONAL GEOMETRIC INSIGHTS

ANGLES OF INTERSECTION

THE ANGLE θ BETWEEN TWO LINES WITH SLOPES m_1 AND m_2 CAN BE CALCULATED USING:

$$\tan \theta = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right|$$

APPLYING THIS TO OUR LINES:

$$m_1 = -\frac{2}{3}, \quad m_2 = \frac{2}{3}$$

CALCULATE NUMERATOR:

$$\left| -\frac{2}{3} - \frac{2}{3} \right| = \left| -\frac{4}{3} \right| = \frac{4}{3}$$

CALCULATE DENOMINATOR:

$$1 + \left(-\frac{2}{3} \times \frac{2}{3} \right) = 1 - \frac{4}{9} = \frac{5}{9}$$

THUS:

$$\tan \theta = \frac{\frac{4}{3}}{\frac{5}{9}} = \frac{4}{3} \times \frac{9}{5} = \frac{36}{15} = \frac{12}{5}$$

FINALLY, THE ANGLE:

$$\theta = \arctan \left(\frac{12}{5} \right) \approx 67.38^\circ$$

THIS INDICATES THAT THESE LINES INTERSECT AT AN ANGLE OF APPROXIMATELY 67.38 DEGREES, WHICH IS NEITHER 90 DEGREES NOR CLOSE TO IT.

PRACTICAL APPLICATIONS AND EXAMPLES

DETERMINING THE RELATIONSHIP IN REAL-WORLD CONTEXTS

UNDERSTANDING THE SLOPES OF LINES CAN HELP IN VARIOUS FIELDS:

- ARCHITECTURE: DESIGNING STRUCTURES WITH SPECIFIC ANGLES.
- NAVIGATION: PLOTTING COURSES THAT ARE PERPENDICULAR OR PARALLEL.
- ENGINEERING: ANALYZING STRESS LINES OR FORCE VECTORS.

EXAMPLE:

SUPPOSE A ROAD RUNS ALONG LINE T WITH A SLOPE OF $-2/3$, AND A RAILWAY TRACK ALONG LINE U WITH A SLOPE OF $2/3$. SINCE THEIR SLOPES ARE NOT EQUAL OR NEGATIVE RECIPROCALLS, THE ROADS INTERSECT AT AN OBLIQUE ANGLE, NOT AT RIGHT ANGLES, AFFECTING PLANNING FOR CROSSINGS OR OVERPASSES.

SUMMARY AND KEY TAKEAWAYS

- THE SLOPE OF A LINE INDICATES ITS STEEPNESS AND DIRECTION.
- LINES WITH IDENTICAL SLOPES ARE PARALLEL.
- LINES WITH SLOPES THAT ARE NEGATIVE RECIPROCALLS ARE PERPENDICULAR.
- IN OUR CASE:
- LINE T HAS A SLOPE OF $-2/3$.
- LINE U HAS A SLOPE OF $2/3$.
- THESE LINES ARE NEITHER PARALLEL NOR PERPENDICULAR.
- THE ANGLE OF INTERSECTION BETWEEN THESE LINES IS APPROXIMATELY 67.38 DEGREES.

CONCLUSION

UNDERSTANDING THE RELATIONSHIP BETWEEN LINES BASED ON THEIR SLOPES IS ESSENTIAL IN COORDINATE GEOMETRY. ALTHOUGH LINE T AND LINE U SHARE A RECIPROCAL MAGNITUDE IN THEIR SLOPES, THEIR SIGNS DIFFER, RESULTING IN LINES THAT CROSS AT AN ACUTE ANGLE BUT ARE NEITHER PARALLEL NOR PERPENDICULAR. RECOGNIZING THESE RELATIONSHIPS ENABLES PRECISE GEOMETRIC ANALYSIS, WHICH IS VITAL IN MATHEMATICS, ENGINEERING, ARCHITECTURE, AND MANY APPLIED SCIENCES.

IF YOU WANT TO DETERMINE WHETHER TWO LINES ARE PARALLEL OR PERPENDICULAR, ALWAYS COMPARE THEIR SLOPES CAREFULLY. REMEMBER:

- PARALLEL: SAME SLOPE.
- PERPENDICULAR: SLOPES ARE NEGATIVE RECIPROCALLS ($m_1 \times m_2 = -1$).

BY MASTERING THESE CONCEPTS, YOU'LL BE ABLE TO ANALYZE AND INTERPRET THE ORIENTATION OF LINES WITH CONFIDENCE!

FREQUENTLY ASKED QUESTIONS

ARE LINE T AND LINE U PARALLEL IF THEIR SLOPES ARE $-2/3$ AND $2/3$ RESPECTIVELY?

NO, LINE T AND LINE U ARE NOT PARALLEL BECAUSE THEIR SLOPES ARE DIFFERENT; PARALLEL LINES HAVE EQUAL SLOPES.

ARE LINE T AND LINE U PERPENDICULAR GIVEN THEIR SLOPES OF $-2/3$ AND $2/3$?

YES, LINE T AND LINE U ARE PERPENDICULAR BECAUSE THEIR SLOPES ARE NEGATIVE RECIPROCALLS OF EACH OTHER.

WHAT IS THE SIGNIFICANCE OF SLOPES BEING NEGATIVE RECIPROCALS IN LINES T AND U?

WHEN SLOPES ARE NEGATIVE RECIPROCALS, THE LINES ARE PERPENDICULAR, MEANING THEY INTERSECT AT A RIGHT ANGLE.

CAN LINES T AND U BE PARALLEL IF THEIR SLOPES ARE $-\frac{2}{3}$ AND $\frac{2}{3}$?

NO, BECAUSE PARALLEL LINES MUST HAVE IDENTICAL SLOPES; THESE SLOPES ARE DIFFERENT.

IF LINE T HAS A SLOPE OF $-\frac{2}{3}$, WHAT SLOPE MUST LINE U HAVE FOR THEM TO BE PERPENDICULAR?

LINE U SHOULD HAVE A SLOPE OF $\frac{3}{2}$ TO BE PERPENDICULAR TO LINE T.

HOW DO YOU DETERMINE IF TWO LINES ARE PERPENDICULAR BASED ON THEIR SLOPES?

TWO LINES ARE PERPENDICULAR IF THEIR SLOPES ARE NEGATIVE RECIPROCALS, MEANING THEIR PRODUCT IS -1 .

ADDITIONAL RESOURCES

UNDERSTANDING THE RELATIONSHIP BETWEEN LINE T AND LINE U BASED ON THEIR SLOPES: PARALLEL, PERPENDICULAR, OR NEITHER?

IN THE REALM OF GEOMETRY, THE ANALYSIS OF LINES AND THEIR SLOPES FORMS A FUNDAMENTAL CORNERSTONE IN UNDERSTANDING SPATIAL RELATIONSHIPS. WHEN EXAMINING TWO LINES, THEIR SLOPES PROVIDE IMMEDIATE CLUES ABOUT HOW THEY INTERACT WITHIN A PLANE. SPECIFICALLY, THE SLOPES OF LINE T AND LINE U—BEING $-\frac{2}{3}$ AND $\frac{2}{3}$ RESPECTIVELY—PROMPT AN INSIGHTFUL INVESTIGATION INTO WHETHER THESE LINES ARE PARALLEL, PERPENDICULAR, OR SIMPLY INTERSECTING AT SOME ANGLE. THIS ARTICLE DELVES INTO THE PRINCIPLES GOVERNING SUCH RELATIONSHIPS, OFFERING A COMPREHENSIVE, ANALYTICAL PERSPECTIVE ON THE MATTER.

FUNDAMENTALS OF LINE SLOPES AND THEIR SIGNIFICANCE

WHAT IS A SLOPE?

THE SLOPE OF A LINE, OFTEN DENOTED AS ' m ,' MEASURES THE STEEPNESS OF THE LINE AND INDICATES THE DIRECTION IT ASCENDS OR DESCENDS ACROSS A COORDINATE PLANE. MATHEMATICALLY, THE SLOPE IS EXPRESSED AS THE RATIO OF THE CHANGE IN Y-COORDINATES TO THE CHANGE IN X-COORDINATES BETWEEN TWO POINTS ON THE LINE:

$$m = \frac{\Delta y}{\Delta x}$$

THIS RATIO ENCAPSULATES THE INCLINE OF THE LINE—POSITIVE SLOPES ASCEND FROM LEFT TO RIGHT, NEGATIVE SLOPES DESCEND, AND ZERO SLOPE INDICATES A HORIZONTAL LINE.

WHY IS THE SLOPE IMPORTANT?

THE SLOPE IS CRUCIAL BECAUSE IT PROVIDES:

- A DESCRIPTOR OF THE LINE'S ORIENTATION WITHIN THE PLANE.
- A BASIS FOR DETERMINING RELATIONSHIPS BETWEEN LINES, SUCH AS WHETHER THEY ARE PARALLEL OR PERPENDICULAR.
- AN AID IN EQUATIONS OF LINES, ESPECIALLY WHEN DERIVING THE LINE'S EQUATION FROM GIVEN POINTS OR SLOPES.

DECIPHERING THE SLOPES OF LINE T AND LINE U

LINE T HAS A SLOPE OF $-\frac{2}{3}$

THIS NEGATIVE SLOPE INDICATES THAT AS x INCREASES, y DECREASES, RESULTING IN A LINE THAT DESCENDS FROM LEFT TO RIGHT. THE RATIO OF $-\frac{2}{3}$ SUGGESTS THAT FOR EVERY 3 UNITS MOVED HORIZONTALLY TO THE RIGHT, THE LINE DROPS 2 UNITS VERTICALLY.

LINE U HAS A SLOPE OF $\frac{2}{3}$

CONVERSELY, LINE U'S POSITIVE SLOPE INDICATES AN UPWARD INCLINE FROM LEFT TO RIGHT. FOR EVERY 3 UNITS MOVED HORIZONTALLY, THE LINE RISES 2 UNITS VERTICALLY.

KEY OBSERVATION: THE SLOPES OF THE TWO LINES ARE RECIPROCAL OF EACH OTHER BUT WITH OPPOSITE SIGNS, A PROPERTY THAT OFTEN HINTS AT PERPENDICULARITY.

ANALYZING THE RELATIONSHIP: ARE LINES T AND U PARALLEL?

DEFINITION OF PARALLEL LINES

PARALLEL LINES ARE LINES IN THE SAME PLANE THAT NEVER INTERSECT, REGARDLESS OF HOW FAR THEY EXTEND. THEIR DEFINING CHARACTERISTIC IS HAVING IDENTICAL SLOPES:

```
\[
\text{If } m_1 = m_2, \text{ then the lines are parallel}
\]
```

COMPARING THE SLOPES OF LINES T AND U

- SLOPE OF T: $-\frac{2}{3}$
- SLOPE OF U: $\frac{2}{3}$

SINCE $-\frac{2}{3} \neq \frac{2}{3}$, THE LINES DO NOT SHARE THE SAME SLOPE. THEREFORE, LINE T AND LINE U ARE NOT PARALLEL.

CONCLUSION: THE DIFFERENCE IN THEIR SLOPES CONFIRMS THAT THE LINES ARE NOT PARALLEL, AS THEY DO NOT RUN SIDE BY SIDE INDEFINITELY WITHOUT INTERSECTING.

ANALYZING THE RELATIONSHIP: ARE LINES T AND U PERPENDICULAR?

DEFINITION OF PERPENDICULAR LINES

PERPENDICULAR LINES INTERSECT AT A RIGHT ANGLE (90°). THE KEY PROPERTY IS THAT THEIR SLOPES ARE NEGATIVE RECIPROCALS OF EACH OTHER:

$$m_1 \times m_2 = -1$$

CALCULATING THE PRODUCT OF THE SLOPES

- SLOPE OF T: $-\frac{2}{3}$
- SLOPE OF U: $\frac{2}{3}$

MULTIPLYING THESE:

$$-\frac{2}{3} \times \frac{2}{3} = -\frac{4}{9}$$

THIS PRODUCT, $-\frac{4}{9}$, IS NOT EQUAL TO -1 . THEREFORE, THE LINES DO NOT SATISFY THE PERPENDICULARITY CONDITION.

ALTERNATIVE APPROACH:

- FOR TWO LINES TO BE PERPENDICULAR, THEIR SLOPES MUST SATISFY:

$$m_1 = -\frac{1}{m_2}$$

- CHECK IF $-\frac{2}{3} = -\frac{1}{\frac{2}{3}}$
- SIMPLIFY THE RIGHT SIDE:

$$-\frac{1}{\frac{2}{3}} = -\frac{3}{2}$$

- SINCE $-\frac{2}{3} \neq -\frac{3}{2}$, THE SLOPES ARE NOT NEGATIVE RECIPROCALS.

CONCLUSION: LINE T AND LINE U ARE NOT PERPENDICULAR.

SUMMARY OF RELATIONSHIPS BETWEEN LINE T AND LINE U

BASED ON THE DETAILED ANALYSIS:

- PARALLEL? NO. THEIR SLOPES ARE DIFFERENT ($-\frac{2}{3}$ vs. $\frac{2}{3}$).
- PERPENDICULAR? NO. THEIR SLOPES ARE NOT NEGATIVE RECIPROCALS, NOR DOES THEIR PRODUCT EQUAL -1 .

THUS, LINE T AND LINE U ARE NEITHER PARALLEL NOR PERPENDICULAR. THEY ARE OBLIQUE LINES THAT INTERSECT AT SOME ANGLE OTHER THAN 90° , WITH THE INTERSECTION ANGLE BEING CALCULABLE BASED ON THEIR SLOPES.

UNDERSTANDING THE ANGLE OF INTERSECTION

CALCULATING THE ANGLE BETWEEN TWO LINES

THE ANGLE (θ) BETWEEN TWO LINES WITH SLOPES (m_1) AND (m_2) CAN BE FOUND USING THE FORMULA:

$$\tan \theta = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right|$$

APPLYING TO LINES T AND U

$$m_1 = -\frac{2}{3}$$
$$m_2 = \frac{2}{3}$$

CALCULATE NUMERATOR:

$$|m_1 - m_2| = \left| -\frac{2}{3} - \frac{2}{3} \right| = \left| -\frac{4}{3} \right| = \frac{4}{3}$$

CALCULATE DENOMINATOR:

$$1 + m_1 m_2 = 1 + \left(-\frac{2}{3} \times \frac{2}{3} \right) = 1 - \frac{4}{9} = \frac{9}{9} - \frac{4}{9} = \frac{5}{9}$$

THUS:

$$\tan \theta = \frac{\frac{4}{3}}{\frac{5}{9}} = \frac{4}{3} \times \frac{9}{5} = \frac{4 \times 9}{3 \times 5} = \frac{36}{15} = \frac{12}{5}$$

FINALLY, COMPUTE (θ) :

$$\theta = \arctan \left(\frac{12}{5} \right) \approx \arctan(2.4) \approx 67.38^\circ$$

INTERPRETATION: THE LINES INTERSECT AT AN ANGLE OF APPROXIMATELY 67.38 DEGREES, WHICH CONFIRMS THEY ARE NEITHER PARALLEL NOR PERPENDICULAR BUT RATHER INTERSECT AT A MODERATE ANGLE.

IMPLICATIONS AND PRACTICAL APPLICATIONS

IN GEOMETRY AND DESIGN

UNDERSTANDING WHETHER LINES ARE PARALLEL OR PERPENDICULAR IS CRUCIAL IN FIELDS LIKE ARCHITECTURE, ENGINEERING, AND COMPUTER GRAPHICS. RECOGNIZING THE SLOPES AND THEIR RELATIONSHIPS GUIDES THE CREATION OF STRUCTURES, VISUALIZATIONS, AND MODELS.

IN MATHEMATICAL PROBLEM SOLVING

KNOWLEDGE OF SLOPES AIDS IN SOLVING SYSTEMS OF EQUATIONS, GRAPHING LINES, AND ANALYZING GEOMETRIC FIGURES. IT ALSO ENHANCES COMPREHENSION OF COORDINATE GEOMETRY PRINCIPLES.

IN REAL-WORLD CONTEXTS

- NAVIGATION AND MAPPING: DETERMINING THE ANGLE OF INTERSECTION BETWEEN ROADS OR PATHS.
- ROBOTICS: PROGRAMMING MOVEMENT PATHS THAT REQUIRE SPECIFIC ANGULAR RELATIONSHIPS.
- ART AND DESIGN: CREATING PATTERNS WITH PRECISE ANGULAR RELATIONSHIPS.

CONCLUSION

THE ANALYSIS OF THE SLOPES OF LINE T ($-2/3$) AND LINE U ($2/3$) REVEALS THAT THESE LINES ARE NEITHER PARALLEL NOR PERPENDICULAR. THEIR SLOPES ARE NEGATIVE RECIPROCAL IN MAGNITUDE BUT NOT IN THE RECIPROCAL SENSE REQUIRED FOR PERPENDICULARITY, AND THEY ARE DISTINCT IN VALUE, RULING OUT PARALLELISM. THE CALCULATED INTERSECTION ANGLE OF APPROXIMATELY 67.38° PROVIDES A DEEPER UNDERSTANDING OF THEIR SPATIAL RELATIONSHIP, EMPHASIZING THE IMPORTANCE OF SLOPE ANALYSIS IN BOTH THEORETICAL AND APPLIED CONTEXTS.

THIS EXPLORATION UNDERSCORES THE SIGNIFICANCE OF SLOPE PROPERTIES IN GEOMETRIC REASONING AND THEIR BROAD APPLICABILITY. RECOGNIZING THESE RELATIONSHIPS NOT ONLY ENRICHES MATHEMATICAL UNDERSTANDING BUT ALSO ENHANCES PRACTICAL SKILLS ACROSS VARIOUS DISCIPLINES, REINFORCING THE FOUNDATIONAL ROLE OF COORDINATE GEOMETRY IN ANALYZING THE WORLD AROUND US.

Line T Has A Slope Of $2/3$ Line U Has A Slope Of $2/3$ Are Line T And Line U Parallel Perpendicular

Line T Has A Slope Of $2/3$ Line U Has A Slope Of $2/3$ Are Line T And Line U Parallel Perpendicular
