Understanding Nathan's Purchase: A Closer Look

The Context of the Shopping Trip

Nathan's decision to buy 8 bottles of iced tea at the grocery store demonstrates a common scenario faced by many shoppers: stocking up on favorite beverages while minimizing costs. With coupons valued at \$0.35 off each bottle, Nathan is strategically reducing his total expenditure.

Calculating the Savings

Let's break down Nathan's savings:

1. Number of Bottles Purchased: 8
2. Coupon Discount per Bottle: \$0.35
3. Total Savings: 8 bottles x \$0.35 = \$2.80

If the regular price per bottle is, for example, \$2.00, then:

- Total After Coupons: \$16.00 - \$2.80 = \$13.20

This example shows how coupons can effectively trim the cost of multiple items, especially when buying in bulk.
