How Are Deaf Babies Similar To Normal Hearing Babies When It Comes To The Sequence Of Languages Learning

Language acquisition is one of the most fascinating aspects of early childhood development. While much focus is often placed on hearing babies and their natural ability to acquire spoken language, deaf babies also undergo a remarkable process of language development that shares many similarities with their hearing peers. Understanding these parallels helps to appreciate the innate human capacity for language learning, regardless of hearing ability, and underscores the importance of early intervention and communication strategies tailored to each child's needs.

In this article, we explore how deaf babies and hearing babies follow similar developmental sequences when acquiring language, emphasizing their shared milestones and the processes that underpin early communication skills.
