The Total Population of the United States in 2015

Official Census and Population Estimates

The most authoritative figure for the U.S. population in 2015 comes from the U.S. Census Bureau, which conducts a comprehensive population count every ten years, with annual estimates in between. The 2010 Census recorded a population of approximately 308.7 million people. By 2015, estimates indicated that the population had grown to approximately 320 million residents.

According to the Census Bureau's 2015 population estimates:

- Total Population: Approximately 321.4 million people.

This figure reflects natural population growth (births minus deaths) and net migration (both domestic and international). The growth rate during this period was around 0.7% annually, a modest but steady increase compared to previous decades.

Methods and Data Sources

The estimation process involved multiple methodologies, including:

- Survey Data: The American Community Survey (ACS) provided quarterly updates on demographic, social, economic, and housing data.
- Administrative Records: Data from government agencies like the Department of Homeland Security, Social Security Administration, and the Department of Education.
- Statistical Models: The Census Bureau employed sophisticated modeling techniques to project population figures between census years, adjusting for migration, fertility, and mortality trends.

These combined sources yield a high-confidence estimate of the population, although minor discrepancies are inevitable due to data collection limitations.
